■ DIMENSION (ขนาดและรูป่าง)

■ DESCRIPTION

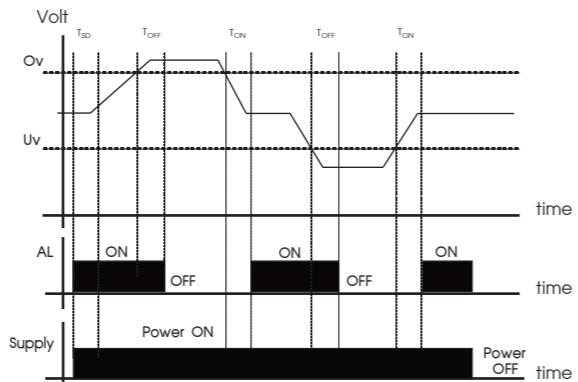

- KM-21 is voltage(V), current(A) meter with protection relay for Over-Under for 3 phases.
- Voltage Range 20-500 VAC.
- Current Range 0.01- 5A. show value maximum 9,999 A by CT Ratio Range 1-2000 (10000/5A).
- Under and Over Voltage, Phase Sequence, Phase Loss , Phase Asymmetry.
- Under and Over Current Protection Relay
- Peak Hold for Maximum of voltage and current.
- Fault Display with Memory.
- RS-485 MODBUS RTU.
- LED show the operation of Output and Peak.
- Manual/Auto Display current and voltage value in each phase.

■ OPERATION

KM-21 is measure and display device for voltage and current in 3 phase all in one. It come with Voltage Protection Relay and Current Relay to protect over-under voltage, phase loss, Unbalance Phase and Phase sequence. It can remember maximum peak of voltage and current that happens for analyze how is system going.

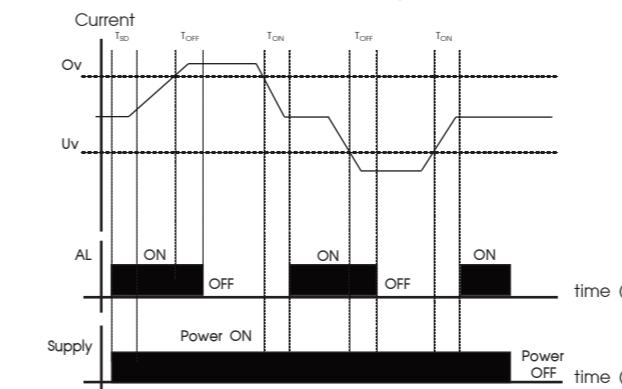

Voltage Protection Relay can set Over-Under for 20-500VAC in one of each phase or all 3 phase. User set delay time before start operation for 1-3600 seconds (ON Delay Time) but phase sequence is not correct. Relay will not operate and do not delay when it start to operate it will detect voltage. If voltage lower or over setting value or unbalance % over than setting or phase loss. Relay will command OFF in 0-3600 sec. which can set to cut fast or slow as demand and show the cause of incident on display. When voltage level back to setting range. Relay will back to ON again in setting Time (ON Delay Time) after KM-21 cut circuit or Relay OFF then can browse to see cause of Relay OFF incident from display. Graph shows Voltage Protection Relay as graph 1.

Graph 1 shows Voltage Protection operation

Current Protection Relay can set low current or over between 0.1 to 9999 A. Set delay time before start operation from 1-3600 seconds (ON Delay Time) when it start operation. It will detect current if current is over than value from setting relay will command OFF in 0-3600 seconds which can set to cut slow or fast as demand and show the cause of incident on display. When current level back to lower level from setting then relay will back to on again in 1-3600 second. After KM-21 cut circuit or Relay OFF can browse to see the cause of Relay OFF incident from display or operate in Reverse Function. Graph shows Current Protection Relay operation as graph 2.

Graph 2 Current Protection Relay operation

Phaseloss

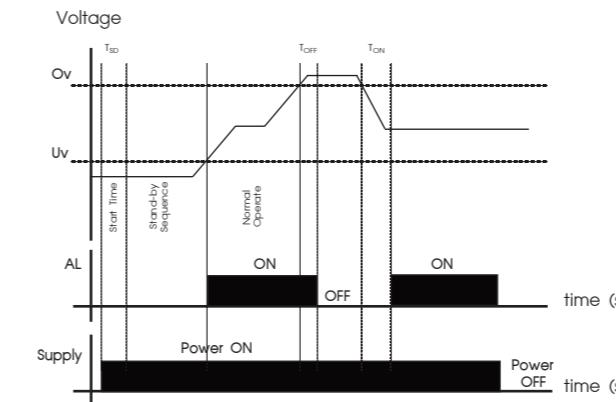

This function will check voltage value of each phase in case that KM-21 read voltage value one in each phase has value equal to 0 Volt. It will delay OFF Delay time then Output will operate.

* Remark: Phaseloss can check in case that motor load has not operated yet.

Stand-by Sequence

This function will check voltage value of each phase in case that voltage or current of each phase after finish Start time phase. Output Relay will not operate until value will be in Output Relay can operate as graph 3.

Graph 3 show Stand-by Sequence of voltage operation.

% Unbalance Voltage calculation

This function will check voltage of each phase compare with average voltage of all 3 phase has the difference more than % Unbalance from setting or not. If it has value more than setting it will delay OFF Delay time then Output Relay will stop operation. Calculate % Unbalance (%UBL) follow as formula 1 when value from measuring more than Ub value from setting will made Output Relay stop operation(OFF) and the screen will show signal -UBL-

$$\%UBL = 100 \times \frac{V_{MD}}{V_{avg}}$$

$$(1) \quad V_{avg} = \left(\frac{V_a + V_b + V_c}{3} \right) \quad (2)$$

MD is maximum absolute value of difference value of voltage of each phase with average voltage.

$$V_{MD} = \text{Max} (|V_a - V_{avg}|, |V_b - V_{avg}|, |V_c - V_{avg}|) \quad (3)$$

ตัวอย่าง หากตั้งค่า Ub = 20 % และค่า V_avg = 183 V, V_a=110 V, V_b = 220, V_c = 220

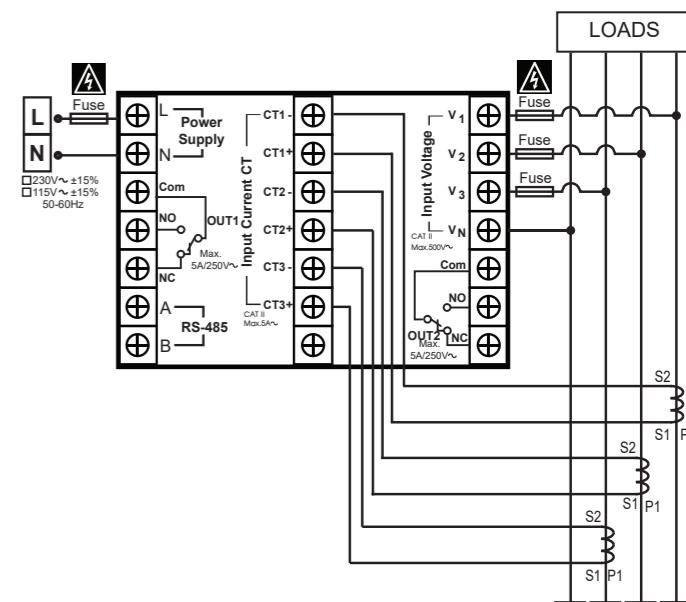

$$|V_a - V_{avg}| = 73 \text{ V} \quad |V_b - V_{avg}| = 37 \text{ V} \quad |V_c - V_{avg}| = 39.8 \text{ V}$$

$$\%UBL = 100 \times \frac{73}{183} = 37\%$$

Display in Manual and Auto

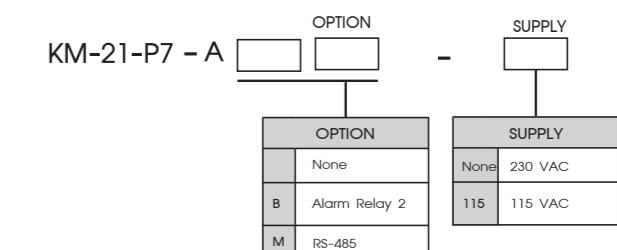

Display Volt, Amp from measure. It can do in Manual mode is press to see value Volt, Amp by pressing Key pad on device or Auto is show Volt, Amp of each phase circulating all the time by user can set to show from 10 seconds to 60 seconds per phase. If user do need to show value in auto mode it can do by setting time to be 0.

■ WIRING DIAGRAM

- Terminals : Max. 500 Vdc CAT III
- Make sure the correct wiring connection before turning on electricity.
- Mis-wiring may cause malfunction of the unit and fire.
- Never modify the unit to prevent damage or incident such as malfunction and fire.
- Installation and commissioning should carried out by qualified personal.

วิธีการ Reset ค่า Peak volt, Current

- ตั้งค่า Parameter **CL-P** ให้เป็น **-CLr**
- ต้องอยู่ Page แสดงผล Peak หน้าไดหน้าหนึ่ง แล้วกดปุ่ม **A + B** ค้างไว้ 5 วินาที
- เมื่อ Reset แล้วค่า Parameter **CL-P** จะเป็น **----**

วิธีการ Reset ค่า Fault Alarm

- ตั้งค่า Parameter **CL-F** ให้เป็น **-CLr**
- ต้องอยู่ Page แสดงผล Fault Alarm หน้าไดหน้าหนึ่ง แล้วกดปุ่ม **A + B** ค้างไว้ 5 วินาที
- เมื่อ Reset แล้วค่า Parameter **CL-P** จะเป็น **----**

วิธีการคำนวนค่า

$$\text{Volt} = \frac{\text{Volt Reg}}{10}$$

$$\text{Current} = \frac{\text{Current Reg}}{\text{Current Exponential}}$$

$$\text{Hz} = \frac{\text{Hz Reg}}{10}$$
